

# Full Stack Development with MERN

## HouseHunt: Finding Your Perfect Rental Home

### Team Members:

Pitta Lavanya – Frontend Development & UI Design

Naga Raju Neelam – Backend Development & API Development

Sheik Mohammad Umar – Database Design & Implementation

V N P L Meghamala Nunna – Testing & System Validation

### Introduction

In today's fast-paced digital world, finding suitable housing efficiently has become a necessity. Traditional rental methods often involve manual searching, fragmented communication with owners, and a lack of real-time availability updates. To address these challenges, **HouseHunt: Finding Your Perfect Rental Home** was developed as a full-stack web application using the **MERN stack** (MongoDB, Express.js, React.js, and Node.js).

HouseHunt provides a centralized platform where **Renters** can browse properties, apply filters based on their needs, and send inquiries directly to owners. The system enables **Owners** to manage their property listings (CRUD operations) and allows **Administrators** to verify owner credentials to maintain platform integrity.

### Project Overview

#### **Purpose:**

The purpose of HouseHunt is to provide a digital solution for managing property rentals efficiently and securely. It eliminates manual inefficiencies by offering an automated, user-friendly, web-based platform.

## Key Features:

### Renter Features

- Secure registration and login.
- Property browsing with detailed descriptions and images.
- Advanced search filters (Price, Property Type, Location).
- Book appointments by selecting date and time.
- Inquiry submission and booking status tracking (Pending/Approved).

### Owner Features

- Account registration and Admin approval request.
- Full CRUD operations (Add, Edit, Delete) for property listings.
- Manage booking inquiries and update property availability.

### Admin Features

- Monitor overall platform activities
- Approve or reject account applications
- Maintain system security and user management.

## Architecture

The application follows a Client-Server Architecture using the MERN stack.

### Frontend Architecture

- Developed using React.js, the frontend utilizes a component-based structure for a responsive and modern UI.
- **Communication:** **Axios** is used to handle RESTful API calls to the backend.
- **State Management:** React Hooks and Moment.js for date/time formatting.

- **Libraries:** Bootstrap, Material UI, Ant Design (Antd), and MDBBootstrap.

## Backend Architecture

The backend is built using Node.js and Express.js following the MVC pattern.

- **Authentication:** JWT (JSON Web Tokens) and bcryptjs for secure password hashing.
- **File Handling:** **Multer** is used for handling property image uploads.
- **Middleware:** Custom authentication middleware to protect private routes.

## Database Architecture

**MongoDB** serves as the NoSQL database with three primary collections:

- **Users:** Stores credentials, roles (Renter/Owner/Admin), and profiles.
- **Property:** Contains property details, images, and owner references (Foreign Key: userID).
- **Booking:** Tracks the relationship between properties, renters, and owners, including status updates.

# **Setup Instructions**

## **Prerequisites**

### **1. Software Requirements**

- **Node.js** (v16 or higher)
- **npm** (comes with Node.js)
- **MongoDB Atlas account** (for cloud database connection)
- **Git** (for cloning the repository)
- **Code Editor** (e.g., VS Code)

### **2. Optional Tools**

- Postman (for API testing)
- MongoDB Compass (for database visualization)

## **Installation**

### **Step 1: Clone the Repository**

Open terminal or command prompt and run:

```
git clone <repository-link>
```

Navigate into the project directory:

```
cd docspot
```

### **Step 2: Install Backend Dependencies**

Navigate to the server folder:

```
cd server
```

Install required dependencies:

```
npm install
```

### Step 3: Configure Environment Variables

Inside the server folder, create a `.env` file and add the following:

```
PORT=5000
MONGO_URI=your_mongodb_connection_string
JWT_SECRET=your_secret_key
```

Replace:

- `your_mongodb_connection_string` with your MongoDB Atlas connection string.
- `your_secret_key` with a secure random string.

### Step 4: Install Frontend Dependencies

Open a new terminal and navigate to the client folder:

```
cd client
```

Install frontend dependencies:

```
npm install
```

### Step 5: Start the Application

Start Backend Server:

```
cd server
npm start
```

Backend runs on:

```
http://localhost:5000
```

Start Frontend Application:

```
cd client
npm start
```

Frontend runs on:

```
http://localhost:3000
```

# **Folder Structure**

## **Client Folder Structure**

```
client/
|
├─ public/
|   └─ index.html
|
├─ src/
|   ├─ components/
|   ├─ pages/
|   ├─ redux/ (or context/)
|   ├─ hooks/
|   ├─ utils/
|   ├─ assets/
|   ├─ App.js
|   └─ index.js
|
└─ package.json
```

## **Server Folder Structure**

```
server/
|
├─ config/
├─ controllers/
├─ models/
├─ routes/
├─ middleware/
├─ utils/
├─ uploads/ (if file upload is used)
├─ server.js
└─ package.json
```

## **Running the Application**

### **Starting the Backend Server**

1. Open a terminal.
2. Navigate to the server directory:

```
cd server
```

3. Start the backend server:

```
npm start
```

If configured correctly, the backend will run on:

```
http://localhost:5000
```

### **Starting the Frontend Server**

1. Open a new terminal window.
2. Navigate to the client directory:

```
cd client
```

3. Start the React application:

```
npm start
```

The frontend application will run on:

```
http://localhost:3000
```

# API Documentation

Base URL:

<http://localhost:5000/api>

## 1. Authentication & User APIs

These endpoints handle the security and identity management for Renters, Owners, and Admins.

**User Registration:** Create a new account as a Renter or Owner.

**User Login:** Authenticates credentials and generates a JWT for session management.

**Profile Management:** Retrieve and update user-specific details such as contact information

## 2. Property APIs (Owner & General)

These endpoints manage the property listings stored in the **Property** collection.

**Add Property:** Allows verified Owners to upload new listings (Type, Amount, Images, Address).

**Get All Properties:** Public endpoint for Renters to browse available listings.

**Update/Delete Property:** CRUD operations for Owners to manage their own listings.

**Filter Properties:** Search for homes based on rent range, location, or property type.

## 3. Booking & Inquiry APIs

These endpoints manage the interaction between Renters and Owners stored in the **Booking** collection.

**Send Inquiry/Book:** Renters submit their details and interest for a specific property.

**Get Bookings:** Owners view inquiries for their properties; Renters view their sent requests.

**Update Booking Status:** Owners approve or reject a "pending" booking request.

## 4. Admin APIs

Endpoints restricted to the Admin role for platform governance

**Manage Users:** View all registered Renters and Owners.

**Owner Approval:** Approve legitimate user requests to upgrade to an "Owner" account to post properties.

**System Activity:** Monitor overall property listings and booking trends.

All protected routes require Authorization: Bearer <JWT\_TOKEN>

## **Authentication**

Authentication is implemented using JWT and bcrypt.

### **Core Security Features**

**Password Hashing:** Passwords are encrypted with **bcryptjs** before storage in MongoDB to ensure data privacy

**JWT Workflow:** A secure token is generated upon login, stored on the client side, and attached to request headers for all protected actions.

**Token Verification:** Custom middleware intercepts requests to verify signatures and enforce user sessions.

**Role-Based Control:** The system enforces specific permissions for **Renters**, **Owners**, and **Admins** using HTTP 401/403 status codes for unauthorized access.

### **Protected Operations**

**Renters:** Securely browse and book properties.

**Owners:** Perform CRUD operations on listings only after verification.

**Admins:** Approve owners and manage platform-wide integrity.

## **User Interface**

The UI is responsive, modern, and role-based.

Includes:

- Login Page
- Registration Page
- Renter Dashboard
- Property Inquiry Form
- Booking History
- Owner Dashboard
- Admin Panel

Designed using React, Bootstrap, and Material UI.

## **Testing**

Manual and functional testing was performed.

### **Frontend Testing**

- Form validation
- Navigation testing
- Role-based rendering
- Property workflow

### **Backend Testing**

- API response validation
- JWT verification
- CRUD operations
- Error handling

## Database Testing

- Data storage validation
- Password hashing verification
- Relationship consistency

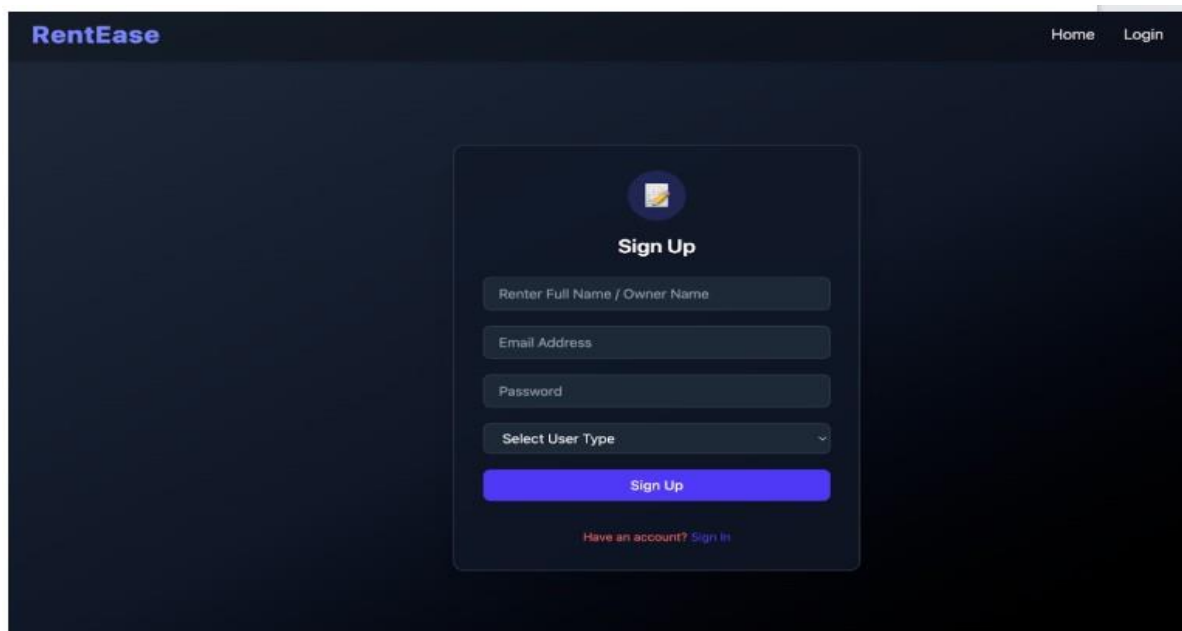

## Integration Testing

- Axios API communication
- Real-time UI updates
- Data consistency

All core functionalities were validated successfully.

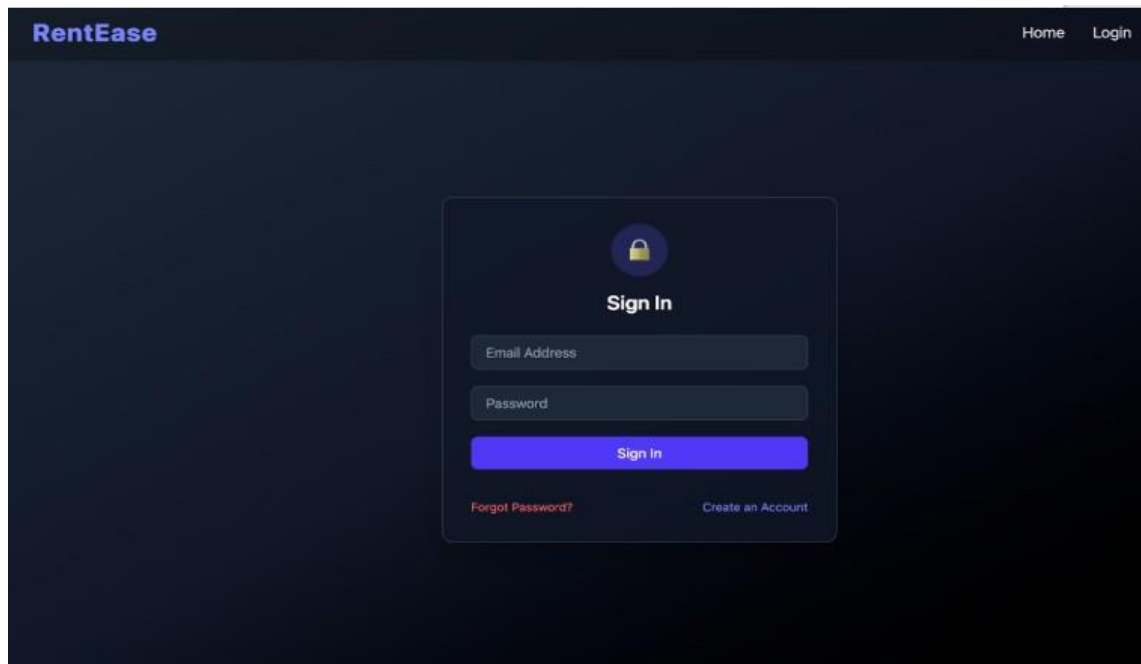

## Screenshots

### Login and register page

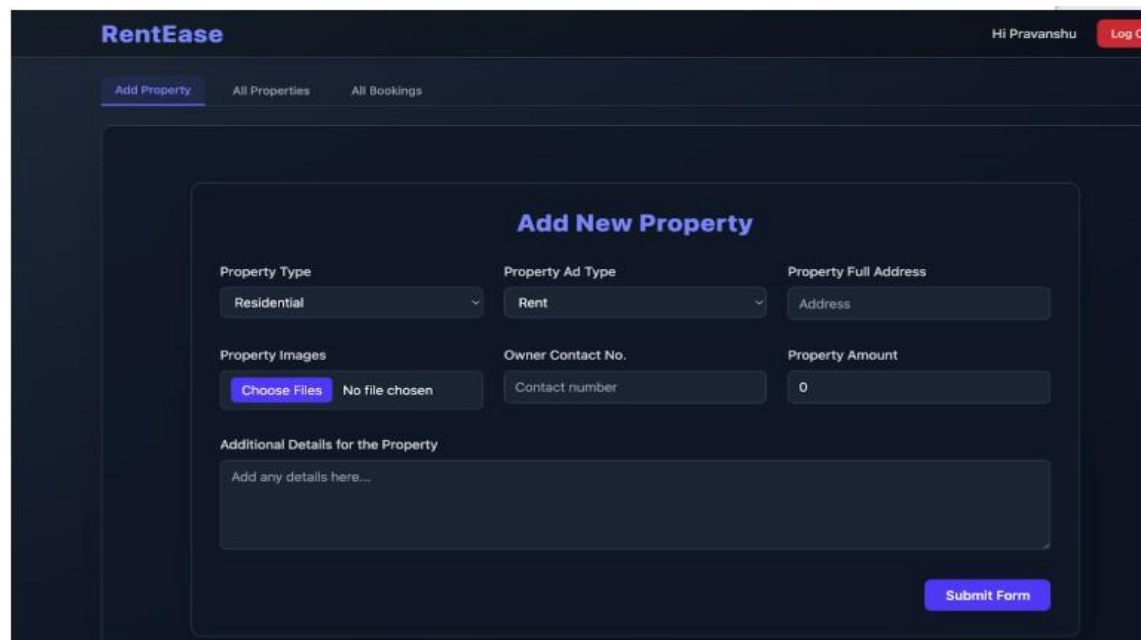

The screenshot displays the 'Sign Up' form on the RentEase website. The form is centered on a dark blue background. At the top left, the 'RentEase' logo is visible. At the top right, there are links for 'Home' and 'Login'. The form itself has a white border and contains the following elements: a circular profile picture placeholder, the title 'Sign Up', four input fields labeled 'Renter Full Name / Owner Name', 'Email Address', 'Password', and 'Select User Type' (which is a dropdown menu), a prominent blue 'Sign Up' button, and a link at the bottom that reads 'Have an account? Sign In'.

## Admin Panel

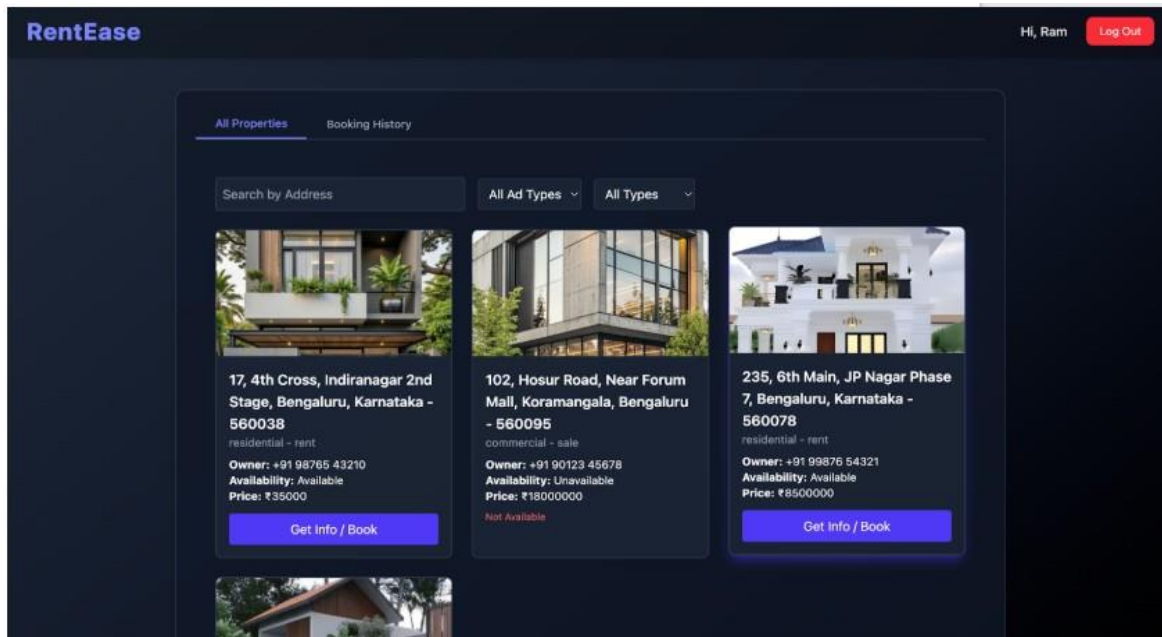

The image shows the 'Sign In' page of the RentEase application. The page has a dark blue background. At the top left is the 'RentEase' logo, and at the top right are links for 'Home' and 'Login'. In the center, there is a white box containing a lock icon and the text 'Sign In'. Below this are two input fields: 'Email Address' and 'Password'. A red 'Sign In' button is positioned below the password field. At the bottom of the white box, there are two links: 'Forgot Password?' and 'Create an Account'.

## Owner panel

The image shows the 'Add New Property' page of the RentEase application. The page has a dark blue background. At the top left is the 'RentEase' logo, and at the top right is the user name 'Hi Pravanshu' next to a red 'Log Out' button. Below the logo, there are three tabs: 'Add Property' (which is active), 'All Properties', and 'All Bookings'. The main content area is a white box titled 'Add New Property'. It contains several form fields: 'Property Type' (a dropdown menu with 'Residential' selected), 'Property Ad Type' (a dropdown menu with 'Rent' selected), 'Property Full Address' (a text input field with 'Address' entered), 'Property Images' (a file upload button labeled 'Choose Files' and 'No file chosen'), 'Owner Contact No.' (a text input field with 'Contact number' entered), and 'Property Amount' (a text input field with '0' entered). Below these fields is a section titled 'Additional Details for the Property' with a text area labeled 'Add any details here...'. A red 'Submit Form' button is located at the bottom right of the white box.

## Tenant Panel

## **Known Issues**

### **No Real-Time Push Notifications:**

The system does not support real-time push notifications; users must manually check their dashboard for status updates like booking confirmations or cancellations as WebSockets or push services are not yet implemented.

### **No Email or SMS Alerts:**

Notifications are limited to in-app updates; appointment confirmations and status reminders are not sent via external communication channels like email or SMS.

### **No Online Payment Integration:**

The platform lacks a payment gateway; rental deposits or consultation fees cannot be processed online and must be handled offline.

### **Basic Error Messages:**

Some system and backend validation errors return generic messages, which could be made more descriptive to improve the debugging process and user experience.

### **No Load Balancing or Caching:**

Advanced performance optimization techniques like caching or load balancing are not implemented, which may lead to performance degradation under heavy user traffic.

### **Manual Testing Only:**

The project relies entirely on manual testing; the absence of automated frameworks like Jest or Mocha may limit long-term maintainability.

### **No Token Refresh Mechanism:**

JWT authentication is implemented without refresh tokens; users must log in again manually once a token expires, which can interrupt the user experience.

### **Limited File Validation:**

File validation for document or image uploads is basic; strict file type checking, size limits, and secure cloud storage integration are not fully realized.

### **Minor Mobile UI Adjustments:**

While the application is responsive, some layout and spacing elements require further optimization for a more polished experience on smaller mobile screens.

## Future Enhancements

- **Online Payment Integration:** Integrate secure gateways (credit/debit, UPI) to allow renters to pay security deposits or booking fees online.

Reduces vacancy rates by securing commitments.

Provides transparent, secure transaction record

Improves overall user convenience.

- **Email and SMS Notifications:** Implement automated alerts for booking confirmations, reminders, and status updates via external APIs.
- **Virtual Property Tours:** Add telemedicine-inspired support for remote viewings through video calling integration and secure online meeting rooms.
- **Rating and Review System:** Allow renters to rate properties and owners to improve transparency and platform trust.
- **Advanced Filtering and Search:** Enhance property discovery with location-based filtering (GPS), interactive availability calendars, and specific amenity ranges.
- **Admin Analytics Dashboard:** Develop a detailed panel showing active user counts, booking statistics, and monthly rental trends.
- **Mobile Application:** Develop a cross-platform app using **React Native** or **Flutter** to improve accessibility and engagement.
- **Cloud File Storage Integration:** Utilize cloud services for property image and document uploads to improve scalability and security.
- **Automated Testing Implementation:** Introduce **Jest** for frontend and **Mocha/Chai** for backend testing to improve code reliability.
- **Token Refresh Mechanism:** Implement refresh tokens to improve session management and prevent frequent login interruptions.

These enhancements will evolve the platform into a more scalable, production-ready system capable of handling large user bases and real-world real estate requirements.
